| **Peer support (postnatal depression)** | **Mums 4 Mums: structured telephone peer-support for women experiencing postnatal depression**  
Research has shown that providing support to mothers experiencing Postnatal Depression (PND) can help reduce their depressive symptoms and improve their coping strategies. The Mums4Mums study aims to evaluate the impact of telephone peer-support for women experiencing PND. This is the proposed study that will test the feasibility of this model.  
*Report:* [www.trialsjournal.com/content/pdf/1745-6215-12-88.pdf](http://www.trialsjournal.com/content/pdf/1745-6215-12-88.pdf) |
| **Befriending (depression and emotional distress)** | **Effects of befriending on depressive symptoms and distress: systematic review and meta-analysis**  
This research study aimed to examine the effectiveness of befriending in the treatment of emotional distress and depressive symptoms. The background was: high rates of emotional distress and depressive symptoms in the community can reflect difficult life events and social circumstances. There is a need for appropriate, low-cost, non-medical interventions for many individuals. Befriending is an emotional support intervention commonly offered by the voluntary sector  
*Findings:*                                                                                                                                 |

Compared with usual care or no treatment, befriending had a modest but significant effect on depressive symptoms and emotional distress in the short term in varied patient groups. Further exploration of active ingredients, appropriate target populations and optimal methods of delivery is required.

**Mentoring (armed service veterans)**

**Leave No Veteran Behind – The Inquiry into Former Armed Service Personnel in Prison visits the United States of America**

The high numbers of veterans appearing in the criminal justice system have been of concern in both the UK and USA. This paper examines the US response, following a visit by the Howard League for Penal Reform’s inquiry into former armed service personnel in prison. Specialist veteran courts operate offering tailored support for veterans to help get their lives back on track. Crucially, ex-service mentors guide veterans through the court process and make sure their housing, mental health, employment and substance misuse issues are dealt with. The first veterans court in Buffalo boasts an impressive 0% recidivism rate.

**Befriending (Chinese people with mental health needs)**

**Evaluation of a Chinese Mental Health Advocacy and Support Project**

Evaluation of a three-year pilot Chinese Mental Health Advocacy and Support Project with the aim to improve access to health care services for Chinese people with mental health needs and to improve the experiences of Chinese people with mental health needs using health care services.

**Key findings and recommendation:**
| Mental health, volunteering and social inclusion | A report underlining how volunteering can help improve the health of people living with mental illness following two independent research studies into schemes based in London (Capital Volunteering) and Nottinghamshire (Notts Healthcare Trust) |
| Mentoring and befriending (volunteering by people with mental illness) |   |
|  | Source: CSV Reports On, No 19, 2008  |
| Befriending | Volunteering at Rampton Hospital  |
|  | Report introducing the findings of service evaluation of volunteering within Nottinghamshire Healthcare NHS Trust and focused on volunteer befrienders at Rampton Hospital.  |

The provision of a community-based advocacy service is essential to meeting the mental health needs of the Chinese community in London. New migrants are a particularly vulnerable group who require practical assistance to meet their basic welfare needs. It recommended that a culturally and linguistically-responsive befriending and support service should be set up to tackle social isolation among Chinese people with mental illness and to assist with welfare needs. This should meet the needs of a diverse population and be provided in the two main spoken dialects: Cantonese and Mandarin.

### Befriending (depression)

**Volunteer befriending as an intervention for depression**
Many episodes of major depression disorder are preceded by severe loss experience. In researching the influence of life events on mental health, the author identified factors which seemed to foster resilience to depression. On the basis of these findings, an intervention involving volunteer befriending with two groups of women was set up, to see if it could prevent depression and aid recovery. Though only a few of the women in the project had been bereaved, the study highlights some of the positive effects of befriending for those planning bereavement care services.

### Befriending (South Asian women – domestic violence and mental health)

**Oppressed voices – understanding the effects of domestic violence for South Asian women**
Summary of a report studying the mental health needs of South Asian women in West Kent and the impact that domestic violence has on their lives. Rethink Sahayak is a South Asian, BME specific service and Rethink is a national mental health charity

- 55%, which is just over half our sample, had suffered a form of domestic abuse
- Difficulties in sleeping, concentration, and anxiety, mood swings were common features. These seem to show that there is a definite impact on the mental health of the individual suffering and also that participants had an understanding of what their mental state was like, under distress
- Report recommends peer support and peer (general) advocacy services (culturally appropriate)
- The women identified supports they would have liked when dealing with mental health problems befriending was one of the supports identified (although not the highest requested)

<tr>
<th>Befriending (neighbourhood)</th>
<th>Promoting Positive Mental Health through Befriending</th>
</tr>
</thead>
<tbody>
<tr>
<td>This paper provides a profile of a voluntary sector neighbourhood befriending service which arose in response to an unmet need within a local community. The origins and development of the service are discussed in the context of the local socioeconomic conditions which prevailed at the time. The discussion includes a consideration of befriending as an international and national movement, and an overview of concepts relevant to the nature and the enterprise of befriending.</td>
<td></td>
</tr>
<tr>
<td>- A brief review illustrates the emerging evidence on befriending, highlighting its potential as a significant health-promoting intervention in health and social care. The service is set within the national policy framework, and the future prospects for befriending as a significant intervention are explored through a discussion of its relationship to the development of social capital and health gain in local communities</td>

| Distance befriending (email, letter, telephone - adults with mental health needs) | Befriending at a distance – a research evaluation of a pilot distance befriending service for adults with mental health needs  
Summary of an evaluation of a distance befriending service for people in the Scottish Highlands. The service was piloted by Befriender Highland Limited and offered befriending by email, letter and telephone to those with mental health needs who were unable to access face-to-face befriending because they live in rural or remote areas or have difficulty leaving their homes  
  - Recommendations were to consider extending the scheme  
Source: Jean Gordon, Anne Mason; University of Stirling, Scotland 2005 |
| Befriending *(long term mental illness)* | **Is befriending by trained volunteers of value to people suffering from long-term mental illness?**  
People who suffer from long term mental illness may be vulnerable to loneliness and isolation when living in community settings. Befriending by volunteers may be an effective way of combating such problems and helping clients to develop social networks. Findings of a small scale project to evaluate the views of people suffering from long term mental illness of an organised befriending scheme.  
  
- All subjects felt befriending was helpful to them  
- 67% thought it had improved their confidence when in social situations  
  
**Source:** T Bradshaw, G Haddock, ‘Journal of Advanced Nursing’, 27 (4) 1998, p713-720  
**Sample:** 9 people who suffer from severe mental illness were interviewed |
| Peer support *(mental health)* | **An investigation into Drop-Ins – exploring the impact of peer support on mental health**  
Taken from the findings of the ‘Strategies for Living’ project, this publication is based on the research done by people who have been users of mental health services and aimed to research how peer support might benefit people in a mental health drop-in setting.  
  
- Peer support emerged as the main contributor to the psychological wellbeing of drop-in users with 82% indicating that the peer support they were able to grant each other was the main reason for their continued attendance  
- Wellbeing was manifested by forming friendships which extended beyond the drop-in, improved confidence and self-esteem, improved communication, reduced isolation  
- The support people offered and received from one another was the primary factor affecting the improvement and stability of drop-in users’ mental health  
- 48% stated that the drop-in lessened isolation, while 34% said they felt so much more confident since using the drop-in that they were now able to offer more help and support to other people |
### Befriending (users of psychiatric services)

**Sample:** 17 interviews with users
